

First comparison and diagnostic tool released for Apple iOS Devices.

Compare more than 100 specifications of your iPhone or iPad device with previous or new models.

São Paulo, SP – February 2, 2013 – Startup Lirum Labs announced the release of its Lirum Device Info app for iPhone, iPod Touch and iPad devices. It's the first app of its kind to provide detailed specifications of each model of each iOS device ever released. With ten categories of specifications, such as Connectivity, Battery and Display, the app organizes more than a hundred fields, and allows the user to visually compare the specifications of two devices side-by-side. For example, the user can choose to compare it's current iPhone 4S with an iPhone 5, to see how many features evolved, and how much each feature has evolved. In addition to the comparison feature, the application offers a number of other unique and helpful features: a real-time graph showing the status of the device memory, with an option to "force release" RAM, a sortable/searchable process list and system log; a real-time multicore CPU usage graph, and a list of active connections (displaying all IP's that your device is connected to). The app also provides a beautiful battery life prediction screen, and real-time sensor feedback (for the accelerometer, gyroscope and magnetometer).

"Sometimes users can get confused about each generation of their iPhones / iPads: not knowing for sure, what GSM or CDMA bands are compatible with their specific model. If the device is refurbished, how to make sure that the accelerometer is OK, or how to quickly identify it as an iPhone 4 or 4S, an iPad 3rd generation or 4th, and so on? Our solution will deal with these situations, and will also provide a complete set of technical information, diagnostic, monitoring and profiling tools." said Lirum Labs founder and CEO, Rogerio Hirooka. "We want this app to be commonplace amongst developers and users. They are welcome to feed our support forum, suggesting more features and providing feedback."

Lirum Device Info is available in the iTunes App Store today, for \$2.99 USD. There is also a Lite version, available for free. The product is an Universal App compatible with iPhone, iPod Touch, iPad and iPad Mini.
